Mean Values of linear measurements and body weight is shown in table 2 & 3 separately for each contact expedition. There is gradual increase in linear measurements and body weight in both sexes from 1-5 yrs age cohort to 19-45 yrs age cohort.

Body build of men and women according to pignet index is shown in table 4 & 5 for each contact expedition separately. Majority of females (83.33%) and males (62.5%) exhibit 'weak' body build. None of the females exhibit 'strong' body build but 12.5% males constitute 'strong' body build. However, 'medium' body build is noticed in both male and female individuals.
